Docket No.:1293.1908

CLAIMS

What is claimed is:

1. A disk clamp of a hard disk drive to affix a magnetic disk that stores data to a spindle motor of the hard disk drive, the disk clamp comprising:

a pressing portion formed along an outer circumference of the disk clamp at an edge portion, to press an upper surface of the disk in a vertical direction;

a stress distribution portion formed inside the pressing portion and having a profile with a curved shape bulged upward to distribute stress applied to the disk; and

a plurality of screw coupling holes into which screws are inserted to be coupled to an upper end portion of the spindle motor and provided at a predetermined distance in a circumferential direction inside the stress distribution portion.

- 2. The disk clamp as claimed in claim 1, wherein the pressing portion has a profile having a curved shape bulged downward.
- 3. The disk clamp as claimed in claim 2, wherein a radius of the curved shape of the stress distribution portion is greater than or equal to a radius of the curved shape of the pressing portion.
- 4. The disk clamp as claimed in claim 2, wherein the pressing portion is continuously formed at the stress distribution portion.
- 5. The disk clamp as claimed in claim 1, wherein the disk clamp has a same thickness throughout an entire portion of the disk clamp.
- 6. The disk clamp as claimed in claim 1, wherein the disk clamp has a dome shape with a center portion bulged upward as a whole and, when the disk clamp is coupled to the spindle motor by the screws, the disk clamp is flattened as a whole.
- 7. The disk clamp as claimed in claim 1, wherein the disk clamp is manufactured by press processing a metal material having a predetermined elasticity.
 - 8. A disk clamp of a hard disk drive, the disk clamp comprising:

11

Docket No.:1293.1908

a substantially S-shaped edge portion to press an upper surface of a disk in a vertical direction and distribute stress applied to the disk; and

an inner portion having a plurality of apertures circumferentially arranged at predetermined distances inside the substantially S-shaped edge portion.

9. A disk clamp of a hard disk drive, the disk clamp comprising: a substantially wave-shaped edge portion to press an upper surface of a disk in a

vertical direction and distribute stress applied to the disk; and

an inner portion having a plurality of apertures circumferentially arranged at predetermined distances inside the substantially wave-shaped edge portion.

- 10. The hard disk drive disk clamp of claim 9, wherein the inner portion of the disk clamp is coupled by screws via the apertures to an upper end portion of a spindle motor of the hard disk drive.
- 11. The disk clamp as claimed in claim 9, wherein an outer portion of the substantially wave-shaped edge portion is a pressing portion with a profile having a substantially curved shape with at least one bulge downward.
- 12. The disk clamp as claimed in claim 11, wherein an inner portion of the substantially wave-shaped edge portion is a stress distribution portion with a profile having a substantially curved shape with at least one bulge upward.
- 13. The disk clamp as claimed in claim 12, wherein a radius of the substantially curved shape of the stress distribution portion is greater than or equal to a radius of the substantially curved shape of the pressing portion.
- 14. The disk clamp as claimed in claim 12, wherein the pressing portion is continuously formed at the stress distribution portion.
- 15. The disk clamp as claimed in claim 9, wherein the disk clamp has a same thickness throughout an entire portion of the disk clamp.

Docket No.:1293.1908

16. The disk clamp as claimed in claim 9, wherein the disk clamp has a dome shape with a center portion bulged upward as a whole and, when the disk clamp is coupled to a spindle motor by screws, the disk clamp is flattened as a whole.

- 17. The disk clamp as claimed in claim 9, wherein the disk clamp is manufactured by press processing a metal material having a predetermined elasticity.
- 18. A disk clamp of a hard disk drive to affix a magnetic disk that stores data to a spindle motor of the hard disk drive, the disk clamp comprising:

a pressing portion formed along an outer circumference of the disk clamp at an edge portion, to press an upper surface of the disk in a vertical direction;

a stress distribution portion formed inside the pressing portion and having a profile with a curved shape bulged upward to form a dome portion to distribute stress applied to the disk, and having a plurality of screw coupling holes into which screws are inserted to couple the disk clamp to an upper end portion of a spindle motor, the screw coupling holes being provided at a predetermined distance in a circumferential direction inside the stress distribution portion,

wherein, when the disk clamp is coupled to the spindle motor by the screws, the disk clamp is flattened as a whole.
